EVIDENCE BEFORE INVESTMENT

Where should we investigate conversion friction before committing budget?

Decision requested: authorize instrumentation QA and a focused diagnosis. A growth claim needs an experiment.

SYNTHETIC. EXPLICITLY.

2021-01-01 to 2021-01-14
Scope: all
Closed, ordered session funnel. USD revenue is deduplicated by transaction.

ELIGIBLE SESSIONS

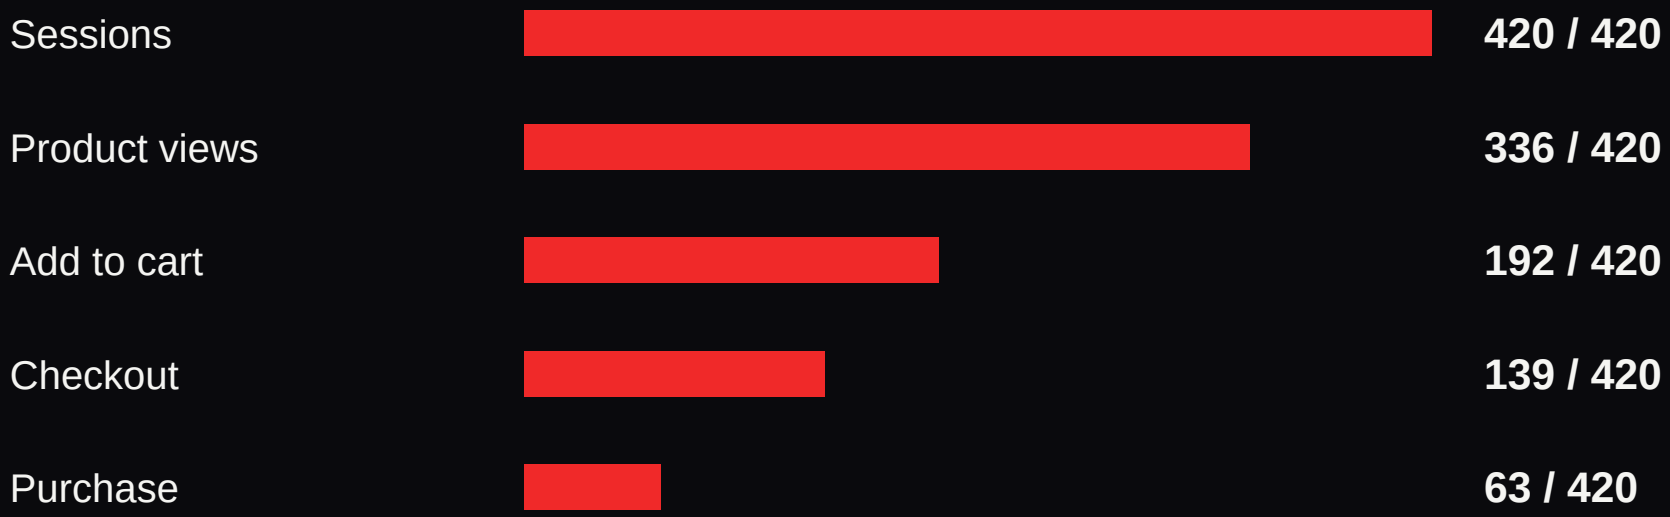
420

63 ordered purchasers / 15% conversion

USD 5040 transaction revenue

Source: deterministic invented event records. No Google extract or observed client result. No matched spend, touchpoint history or causal design.

144 lost at add to cart; 54.68% at purchase



Largest absolute loss and largest proportional loss can point to different transitions. Neither establishes why people left.

COUNTS LOCATE A QUESTION. THEY DO NOT EXPLAIN IT.

01 / RELEVANCE

Visitors may not see enough value.

Need: product research and message testing. Funnel counts alone cannot establish intent.

02 / FRICTION

The interaction may be difficult.

Need: consented usability evidence and device/error breakdown. No such evidence is available.

03 / COLLECTION

Events may be missing or duplicated.

Need: Tag Assistant, GA4 DebugView and transaction reconciliation before interpreting the loss.

DIAGNOSE THE TOP TRANSITION

Audit the add to cart transition, then test one clearer experience proposition.

Priority 1: Product views to Add to cart
144 lost x 0.4286 loss fraction
Score 61.71 (heuristic)

Gate: verify event delivery first.
Defer channel budget reallocation: spend and incremental effects are unavailable.

AGREE THE RULE BEFORE THE RESULT

Hypothesis: a clearer product proposition improves purchase-session conversion. Confirm with research before choosing a variant.

50/50 allocation | baseline 15%
10% relative MDE | alpha .05 | 80% power
Approx. 8,896 independent sessions per arm

SHIP

Only if the 95% interval is positive, estimated uplift meets MDE and guardrails pass. Otherwise retain control or declare inconclusive.

PAUSE / OWNERSHIP

Pause for broken delivery, sample-ratio mismatch, checkout errors or material revenue/session harm. Agree owner, thresholds, clustering, whole-week duration and conversion lag before launch.
