FROM SIGNAL TO DECISION.

Where should a marketing team investigate friction before committing to an experiment?

Objective: improve ordered purchase-session conversion with evidence and clear measurement.

KNOW THE BOUNDARIES.

SYNTHETIC / ILLUSTRATIVE
2021-01-01 to 2021-01-14 | USD | UTC
Channel: all

Deterministic complete fixture; no sampling. Not Google data.
Invented event records, not an extract of public GA4.
Not observed client performance.

THE NUMBERS. DEFINED.

420 eligible sessions
63 ordered purchasing sessions
15% conversion = purchasing sessions / eligible sessions
USD 5040 deduplicated transaction revenue

Closed funnel; each event must follow its predecessor.

FIND THE FRICTION.

Sessions: 420 sessions (100.0% of eligible)
Product views: 336 sessions (80.0% of eligible)
Add to cart: 192 sessions (45.7% of eligible)
Checkout: 139 sessions (33.1% of eligible)
Purchase: 63 sessions (15.0% of eligible)

Largest absolute step loss: 144 at Add to cart.
Drop-off does not establish why it happened.

ONE CLEAR NEXT MOVE.

Audit the add to cart transition, then test one clearer experience proposition.

Alternative considered: channel budget reallocation. Deferred because no matched spend or causal evidence exists. Human judgment required.

TEST. LEARN. THEN DECIDE.

Hypothesis: a clearer product proposition improves ordered conversion.
Primary: purchase-session conversion. Guardrails: revenue/session, checkout errors.
Instrumentation: audit GA4/GTM funnel and unique transactions first.
Owner: portfolio reviewer. Review date: agree before launch.
Set sample size and full-week duration before randomization.
No uplift promised.
